PEROXISOME PROLIFERATOR ACTIVATED RECEPTOR ALPHA AGONISTS

BACKGROUND OF THE INVENTION

Peroxisome Proliferator Activated Receptors (PPARs) are
5 members of the nuclear hormone receptor super family, which
are ligand-activated transcription factors regulating gene
expression. Various subtypes of PPARs have been discovered.
These include PPAR α , NUC1, PPAR γ and PPAR δ .

The PPAR α receptor subtypes are reported to be
10 activated by medium and long-chain fatty acids. They are
involved in stimulating beta-oxidation of fatty acids and
with the activity of fibrates which reportedly produce a
substantial reduction in plasma triglycerides and moderate
reduction in low density lipoprotein (LDL) cholesterol.

15 PPAR α , PPAR γ and PPAR δ receptors have been
implicated in diabetes mellitus, cardiovascular disease,
obesity, Syndrome X and gastrointestinal disease, such as,
inflammatory bowel disease. Syndrome X is the combination
of symptoms which include hyperinsulemia combined with
20 hypertension, elevated body weight, elevated triglycerides
and elevated LDL.

Current PPAR agonist treatment for Syndrome X relates
to the use of thiazolidinediones (TZDs) or other insulin
25 sensitivity enhancers (ISEs). TZDs are a class of PPAR
gamma agonists which have been shown to increase the
sensitivity of insulin sensitive cells. Increasing insulin
sensitivity rather than the amount of insulin in the blood
reduces the likelihood of hypoglycemic coma. However, TZDs
30 and ISEs typically have little effect in preventing the
cardiovascular part of Syndrome X in that their
administration usually dose not result in the lowering of

triglycerides and LDL-cholesterol while raising HDL-cholesterol. Furthermore, side effects commonly associated with treatment with TZDs include significant weight gain, and, for troglitazone, liver toxicity. Therefore, a need exists for new pharmaceutical agents which affect treat or prevent cardiovascular disease, particularly that associated with Syndrome X, while preventing or minimizing weight gain, and more preferably while improving insulin sensitivity.

A further preferred embodiment is the compounds of the present invention having Formula IV, and their respective pharmaceutical compositions, have a structure represented by Structural Formula IV.

10

The present invention further provides a desired
crystalline Propanoic Acid, 2-[4-[3-[2,5-dihydro-1-[(4-
10 methylphenyl)methyl]-5-oxo-1H-1,2,4-triazol-3-
yl]propyl]phenoxy]-2-methyl- having an X-ray diffraction
pattern which comprises at least one of the following peaks:
13.2 +/- 0.2, 15.9 +/- 0.2, 20.7 +/- 0.2, and 24.1 +/- 0.2
in 2θ when obtained from a copper radiation source.

15 The compounds of Structural Formula I may contain one
or more chiral centers, and exist in different optically
active forms. When compounds of Structural Formula I
contain one chiral center, the compounds exist in two
enantiomeric forms and the present invention includes both
20 enantiomers and mixtures of enantiomers, such as racemic
mixtures. The enantiomers may be resolved by methods known
to those skilled in the art, for example by formation of
diastereoisomeric salts which may be separated, for example,

by crystallization; formation of diastereoisomeric derivatives or complexes which may be separated, for example, by crystallization, gas-liquid or liquid chromatography; selective reaction of one enantiomer with an enantiomer-specific reagent, for example enzymatic esterification; or gas-liquid or liquid chromatography in a chiral environment, for example on a chiral support for example silica with a bound chiral ligand or in the presence of a chiral solvent. It will be appreciated that where the desired enantiomer is converted into another chemical entity by one of the separation procedures described above, a further step is required to liberate the desired enantiomeric form. Alternatively, specific enantiomers may be synthesized by asymmetric synthesis using optically active reagents, substrates, catalysts or solvents, or by converting one enantiomer into the other by asymmetric transformation.

When a compound represented by Structural Formula I has more than one chiral substituent it may exist in diastereoisomeric forms. The diastereoisomeric pairs may be separated by methods known to those skilled in the art, for example chromatography or crystallization and the individual enantiomers within each pair may be separated as described above. The present invention includes each diastereoisomer of compounds of Structural Formula I and mixtures thereof.

Certain compounds of Structural Formula I may exist in different stable conformational forms which may be separable. Torsional asymmetry due to restricted rotation about an asymmetric single bond, for example because of steric hindrance or ring strain, may permit separation of different conformers. The present invention includes each

conformational isomer of compounds of Structural Formula I and mixtures thereof.

Certain compounds of Structural Formula I may exist in zwitterionic form and the present invention includes each
5 zwitterionic form of compounds of Structural Formula I and mixtures thereof.

Certain compounds of Structural Formula I and their salts may also exist in the form of solvates, for example hydrates, and the present invention includes each solvate
10 and mixtures thereof.

"Pharmaceutically-acceptable salt" refers to salts of the compounds of the Structural Formula I which are substantially non-toxic to mammals. Typical
pharmaceutically-acceptable salts include those salts
15 prepared by reaction of the compounds of the present invention with a mineral or organic acid or an organic or inorganic base. Such salts are known as base addition salts, respectively. It should be recognized that the particular counterion forming a part of any salt of this
20 invention is not of a critical nature, so long as the salt as a whole is pharmaceutically-acceptable and as long as the counterion does not contribute undesired qualities to the salt as a whole.

By virtue of its acidic moiety, a compound of
25 Structural Formula I forms salts with pharmaceutically acceptable bases. Some examples of base addition salts include metal salts such as aluminum; alkali metal salts such as lithium, sodium or potassium; and alkaline earth metal salts such as calcium and magnesium; and ammonium or
30 substituted ammonium salts. Examples of substituted ammonium salts include, for instance, those with lower alkylamines such as trimethylamine, triethylamine;

hydroxyalkylamines such as 2-hydroxyethylamine, bis-(2-hydroxyethyl)-amine or tri-(2-hydroxyethyl)-amine, cycloalkylamines such as bicyclohexylamine or dibenzylpiperidine, N-benzyl- β -phenethylamine, 5 dehydroabietylamine, N,N'-bisdehydro-abietylamine, glucamine, N-methylglucamine; bases of the pyridine type such as pyridine, collidine, quinine or quinoline; and salts of basic amino acids such as lysine and arginine.

Examples of inorganic bases include, without 10 limitation, sodium hydroxide, potassium hydroxide, potassium carbonate, sodium carbonate, sodium bicarbonate, potassium bicarbonate, calcium hydroxide, calcium carbonate, and the like.

Compounds of Structural Formula I, which are 15 substituted with a basic group, may exist as salts with pharmaceutically acceptable acids. The present invention includes such salts. Examples of such salts include hydrochlorides, hydrobromides, sulfates, methanesulfonates, nitrates, maleates, acetates, citrates, fumarates, tartrates 20 [e.g. (+)-tartrates, (-)-tartrates or mixtures thereof including racemic mixtures], succinates, benzoates and salts with amino acids such as glutamic acid.

These salts may be prepared by methods known to those skilled in the art.

25 Certain compounds of Structural Formula I and their salts may also exist in the form of solvates, for example hydrates, and the present invention includes each solvate and mixtures thereof.

Poorly crystalline and/or amorphous materials are 30 typically less desirable than highly crystalline materials for formulation processing. Amorphous compounds are chemically and physically less stable as they tend to adsorb

significant amounts of water. The adsorption of water by an amorphous material in a gelatin capsule, for example, may cause the capsule to shrink or buckle as moisture is transferred from the capsule to the amorphous component. In addition, amorphous compounds have a tendency to precipitate out of solutions containing them. If an amorphous drug substance precipitates from a delivery solution, the dissolution and bioavailability properties of the drug may be negatively affected.

10 In addition, it is generally not desirable to formulate pharmaceuticals containing substantial amounts of organic solvent (e.g., ethyl acetate) due to potential solvent toxicity to the recipient thereof and changes in potency of the pharmaceutical as a function of the solvent. In addition, from a manufacturing perspective, it is also generally less desirable to prepare non-crystalline materials whenever said preparation involves a collection of the final product via filtration. Such filtrations are often more difficult to perform when the material collected is non-crystalline. Moreover, it is also generally less desirable, from a manufacturing perspective, to formulate pharmaceuticals containing substantial amounts of water (hydrates) because the level of hydration will typically be some function of the relative humidity at which the pharmaceutical is produced and stored. In other words, potency variability is typically more problematic with a hydrate relative to its anhydrous form. The present invention provides a desired crystalline form.

30 Prodrugs are compounds of the present invention, which have chemically or metabolically cleavable groups and become by solvolysis or under physiological conditions the compounds of the invention which are pharmaceutically active

in vivo. Prodrugs include acid derivatives well known to practitioners of the art, such as, for example, esters prepared by reaction of the parent acidic compound with a suitable alcohol, or amides prepared by reaction of the parent acid compound with a suitable amine. Simple aliphatic or aromatic esters derived from acidic groups pendent on the compounds of this invention are preferred prodrugs. In some cases it is desirable to prepare double ester type prodrugs such as (acyloxy) alkyl esters or ((alkoxycarbonyl)oxy)alkyl esters. Particularly preferred esters as prodrugs are methyl, ethyl, propyl, isopropyl, n-butyl, isobutyl, tert-butyl, morpholinoethyl, and N,N-diethylglycolamido.

Methyl ester prodrugs may be prepared by reaction of the acid form of a compound of Formula I in a medium such as methanol with an acid or base esterification catalyst (e.g., NaOH, H₂SO₄). Ethyl ester prodrugs are prepared in similar fashion using ethanol in place of methanol.

Morpholinylethyl ester prodrugs may be prepared by reaction of the sodium salt of a compound of Structural Formula I (in a medium such as dimethylformamide) 4-(2-chloroethyl)morphine hydrochloride (available from Aldrich Chemical Co., Milwaukee, Wisconsin USA, Item No. C4,220-3).

Characterization of Propanoic Acid, 2-[4-[3-[2,5-dihydro-1-[(4-methylphenyl)methyl]-5-oxo-1H-1,2,4-triazol-3-yl]propyl]phenoxy]-2-methyl- crystalline form

Differential scanning calorimetry/thermogravimetric analysis (DSC/TGA), moisture sorption/desorption, and X-ray powder diffraction (XRD) methods were used to characterize Propanoic Acid, 2-[4-[3-[2,5-dihydro-1-[(4-methylphenyl)methyl]-5-oxo-1H-1,2,4-triazol-3-yl]propyl]phenoxy]-2-methyl-. TGA is a measure of the

thermally induced weight loss of the material as a function of temperature. It is most commonly used to study desolvation processes and quantatively determine the total volatile content of a solid. DSC is a technique that is often used to screen compounds for polymorphism because the temperatures(s) at which a physical change in a material occurs is usually characteristic of that material. Moisture sorption isotherms provide evaluation of the degree of hydroscopicity associated with a given material and characterization of non-hydrates and hydrates. Lastly, XRD is a technique that detects long-range order in a crystalline material.

The thermodynamically favorable crystalline Propanoic Acid, 2-[4-[3-[2,5-dihydro-1-[(4-methylphenyl)methyl]-5-oxo-1H-1,2,4-triazol-3-yl]propyl]phenoxy]-2-methyl-polymorph was characterized using a Siemens D5000 diffractometer equipped with a CuK α radiation source (λ = 1.54056 Angstroms) and a solid state detector.

It is well known in the crystallography art that, for any given crystal form, the relative intensities of the diffraction peaks may vary due to preferred orientation resulting from factors such as crystal morphology and habit. Where the effects of preferred orientation are present, peak intensities are altered, but the characteristic peak positions of the polymorph are unchanged. See, e.g., The United States Pharmacopeia #23, National Formulary #18, pages 1843-1844, 1995. Furthermore, it is also well known in the crystallography art that, for any given crystal form, the angular peak positions may vary slightly. For example, peak positions can shift due to a variation in the temperature at which a sample is analyzed, sample displacement, or the presence or absence of an internal

standard. In the present case, a peak position variability of ± 0.2 in 2θ will take into account these potential variations without hindering the unequivocal identification of the desired crystalline form.

5 A well known and accepted method for searching crystal forms in the literature is the "Fink" method. The Fink method uses the four most intense lines for the initial search followed by the next four most intense lines. In accord with the Fink method, based on peak intensities as well as
10 peak position, the desired crystalline form of Propanoic Acid, 2-[4-[3-[2,5-dihydro-1-[(4-methylphenyl)methyl]-5-oxo-1H-1,2,4-triazol-3-yl]propyl]phenoxy]-2-methyl- may be identified by the presence of peaks at 13.2 ± 0.2 , 15.9 ± 0.2 , 20.7 ± 0.2 , and 24.1 ± 0.2 in 2θ ; when the
15 pattern is obtained from a copper radiation source. The presence of desired Propanoic Acid, 2-[4-[3-[2,5-dihydro-1-[(4-methylphenyl)methyl]-5-oxo-1H-1,2,4-triazol-3-yl]propyl]phenoxy]-2-methyl- crystalline form may be further verified by peaks at 7.9 ± 0.2 , 17.37 ± 0.2 , and 19.5 ± 0.2 in 2θ ; when the pattern is obtained from a copper
20 radiation source.

The term, "active ingredient" means the compounds generically described by Structural Formula I as well as the salts, solvates, and prodrugs of such compounds.

25 The term "pharmaceutically acceptable" means that the carrier, diluent, excipients and salt must be compatible with the other ingredients of the composition, and not deleterious to the recipient thereof. Pharmaceutical compositions of the present invention are prepared by
30 procedures known in the art using well known and readily available ingredients.

"Preventing" refers to reducing the likelihood that the recipient will incur or develop any of the pathological conditions described herein.

5 "Treating" refers to mediating a disease or condition and preventing, or mitigating, its further progression or ameliorate the symptoms associated with the disease or condition.

"Pharmaceutically-effective amount" means that amount of a compound, or of its salt, solvate, hydrate or prodrug
10 thereof, that will elicit the biological or medical response of a tissue, system, or mammal. Such an amount can be administered prophylactically to a patient thought to be susceptible to development of a disease or condition. Such amount when administered prophylactically to a patient can
15 also be effective to prevent or lessen the severity of the mediated condition. Such an amount is intended to include an amount which is sufficient to modulate a PPAR alpha receptor or to prevent or mediate a disease or condition. Conditions prevented or treated by PPAR α receptors include
20 diabetes mellitus, cardiovascular disease, Syndrome X, obesity and gastrointestinal disease.

A "mammal" is an individual animal that is a member of the taxonomic class Mammalia. The class Mammalia includes humans, monkeys, chimpanzees, gorillas, cattle, swine,
25 horses, sheep, dogs, cats, mice, and rats.

Administration to a human is most preferred. The compounds and compositions of the present invention are useful for the treatment and/or prophylaxis of cardiovascular disease, for raising serum HDL cholesterol
30 levels, for lowering serum triglyceride levels and for lower serum LDL cholesterol levels. Elevated triglyceride and LDL levels, and low HDL levels, are risk factors for the

development of heart disease, stroke, and circulatory system disorders and diseases.

The compounds and compositions of the present invention are also useful for treating and/or preventing obesity.

5 Further, these compounds and compositions are useful for the treatment and/or prophylaxis of non-insulin dependent diabetes mellitus (NIDDM) with reduced or no body weight gains by the patients. Furthermore, the compounds and compositions of the present invention are useful to treat or
10 prevent acute or transient disorders in insulin sensitivity, such as sometimes occur following surgery, trauma, myocardial infarction, and the like. The physician of ordinary skill will know how to identify humans who will benefit from administration of the compounds and
15 compositions of the present invention.

The present invention further provides a method for the treatment and/or prophylaxis of hyperglycemia in a human or non-human mammal which comprises administering an effective, non-toxic amount of a compound of the general formula (I),
20 or a tautomeric form thereof and/or a pharmaceutically acceptable salt thereof and/or a pharmaceutically acceptable solvate thereof to a hyperglycemic human or non-human mammal in need thereof.

They are useful as therapeutic substances in preventing
25 or treating Syndrome X, diabetes mellitus and related endocrine and cardiovascular disorders and diseases in human or non-human animals.

The invention also relates to the use of a compound of Formula I as described above, for the manufacture of a
30 medicament for treating a PPAR α mediated condition.

A therapeutically effective amount of a compound of Structural Formula I can be used for the preparation of a

medicament useful for treating Syndrome X, diabetes, treating obesity, lowering triglyceride levels, lowering serum LDL levels, raising the plasma level of high density lipoprotein, and for treating, preventing or reducing the risk of developing atherosclerosis, and for preventing or reducing the risk of having a first or subsequent atherosclerotic disease event in mammals, particularly in humans. In general, a therapeutically effective amount of a compound of the present invention typically reduces serum triglyceride levels of a patient by about 20% or more, and increases serum HDL levels in a patient. Preferably, HDL levels will be increased by about 30% or more. In addition, a therapeutically effective amount of a compound, used to prevent or treat NIDDM, typically reduces serum glucose levels, or more specifically HbA1c, of a patient by about 0.7% or more.

Advantageously, compositions containing the compound of Structural Formula I or the salts thereof may be provided in dosage unit form, preferably each dosage unit containing from about 1 to about 500 mg be administered although it will, of course, readily be understood that the amount of the compound or compounds of Structural Formula I actually to be administered will be determined by a physician, in the light of all the relevant circumstances.

When used herein Syndrome X includes pre-diabetic insulin resistance syndrome and the resulting complications thereof, insulin resistance, non-insulin dependent diabetes, dyslipidemia, hyperglycemia obesity, coagulopathy, hypertension and other complications associated with diabetes. The methods and treatments mentioned herein include the above and encompass the treatment and/or prophylaxis of any one of or any combination of the

following: pre-diabetic insulin resistance syndrome, the resulting complications thereof, insulin resistance, Type II or non-insulin dependent diabetes, dyslipidemia, hyperglycemia, obesity and the complications associated with diabetes including cardiovascular disease, especially atherosclerosis.

The compositions are formulated and administered in the same general manner as detailed herein. The compounds of the instant invention may be used effectively alone or in combination with one or more additional active agents depending on the desired target therapy. Combination therapy includes administration of a single pharmaceutical dosage composition which contains a compound of Structural Formula I and one or more additional active agents, as well as administration of a compound of Structural Formula I and each active agent in its own separate pharmaceutical dosage formulation. For example, a compound of Structural Formula I or thereof and an insulin secretagogue such as biguanides, thiazolidinediones, sulfonylureas, insulin, or α -glucosidase inhibitors can be administered to the patient together in a single oral dosage composition such as a tablet or capsule, or each agent administered in separate oral dosage formulations. Where separate dosage formulations are used, a compound of Structural Formula I and one or more additional active agents can be administered at essentially the same time, i.e., concurrently, or at separately staggered times, i.e., sequentially; combination therapy is understood to include all these regimens.

An example of combination treatment or prevention of atherosclerosis may be wherein a compound of Structural Formula I or salts thereof is administered in combination with one or more of the following active agents:

antihyperlipidemic agents; plasma HDL-raising agents; antihypercholesterolemic agents, fibrates, vitamins, aspirin, and the like. As noted above, the compounds of Structural Formula I can be administered in combination with
5 more than one additional active agent.

Another example of combination therapy can be seen in treating diabetes and related disorders wherein the compounds of Structural Formula I, salts thereof can be effectively used in combination with, for example,
10 sulfonylureas, biguanides, thiazolidinediones, α -glucosidase inhibitors, other insulin secretagogues, insulin as well as the active agents discussed above for treating atherosclerosis.

The compounds of the present invention, and the
15 pharmaceutically acceptable salts, solvates and hydrates thereof, have valuable pharmacological properties and can be used in pharmaceutical compositions containing a therapeutically effective amount of a compound of the present invention, or pharmaceutically acceptable salts,
20 esters or prodrugs thereof, in combination with one or more pharmaceutically acceptable excipients. Excipients are inert substances such as, without limitation carriers, diluents, fillers, flavoring agents, sweeteners, lubricants, solubilizers, suspending agents, wetting agents, binders,
25 disintegrating agents, encapsulating material and other conventional adjuvants. Proper formulation is dependent upon the route of administration chosen. Pharmaceutical compositions typically contain from about 1 to about 99 weight percent of the active ingredient which is a compound
30 of the present invention.

Preferably, the pharmaceutical formulation is in unit dosage form. A "unit dosage form" is a physically discrete

unit containing a unit dose, suitable for administration in human subjects or other mammals. For example, a unit dosage form can be a capsule or tablet, or a number of capsules or tablets. A "unit dose" is a predetermined quantity of the active compound of the present invention, calculated to produce the desired therapeutic effect, in association with one or more pharmaceutically-acceptable excipients. The quantity of active ingredient in a unit dose may be varied or adjusted from about 0.1 to about 1000 milligrams or more according to the particular treatment involved.

The dosage regimen utilizing the compounds of the present invention is selected by one of ordinary skill in the medical or veterinary arts, in view of a variety of factors, including, without limitation, the species, age, weight, sex, and medical condition of the recipient, the severity of the condition to be treated, the route of administration, the level of metabolic and excretory function of the recipient, the dosage form employed, the particular compound and salt thereof employed, and the like.

Preferably, the compounds of the present invention are administered in a single daily dose, or the total daily dose may be administered in divided doses, two, three, or more times per day. Where delivery is via transdermal forms, of course, administration is continuous.

Suitable routes of administration of pharmaceutical compositions of the present invention include, for example, oral, eyedrop, rectal, transmucosal, topical, or intestinal administration; parenteral delivery (bolus or infusion), including intramuscular, subcutaneous, intramedullary injections, as well as intrathecal, direct intraventricular, intravenous, intraperitoneal, intranasal, or intraocular injections. The compounds of the invention can

also be administered in a targeted drug delivery system, such as, for example, in a liposome coated with endothelial cell-specific antibody.

For oral administration, the compounds can be
5 formulated readily by combining the active compounds with pharmaceutically acceptable carriers well known in the art. Such carriers enable the compounds of the invention to be formulated as tablets, pills, powders, sachets, granules, dragees, capsules, liquids, elixers, tinctures, gels,
10 emulsions, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated. Pharmaceutical preparations for oral use can be obtained by combining the active compound with a solid excipient, optionally grinding a resulting mixture, and processing the mixture of granules,
15 after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores.

For oral administration in the form of a tablet or capsule, the active ingredient may be combined with an oral, non-toxic, pharmaceutically-acceptable carrier, such as,
20 without limitation, lactose, starch, sucrose, glucose, methyl cellulose, calcium carbonate, calcium phosphate, calcium sulfate, sodium carbonate, mannitol, sorbitol, and the like; together with, optionally, disintegrating agents, such as, without limitation, cross-linked polyvinyl
25 pyrrolidone, maize, starch, methyl cellulose, agar, bentonite, xanthan gum, alginic acid, or a salt thereof such as sodium alginate, and the like; and, optionally, binding agents, for example, without limitation, gelatin, acacia, natural sugars, beta-lactose, corn sweeteners, natural and
30 synthetic gums, acacia, tragacanth, sodium alginate, carboxymethyl-cellulose, polyethylene glycol, waxes, and the like; and, optionally, lubricating agents, for example,

without limitation, magnesium stearate, sodium stearate, stearic acid, sodium oleate, sodium benzoate, sodium acetate, sodium chloride, talc, and the like. When a dosage unit form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier such as a fatty oil.

Solid form formulations include powders, tablets and capsules. A solid carrier can be one or more substance which may also act as flavoring agents, lubricants, solubilisers, suspending agents, binders, tablet disintegrating agents and encapsulating material.

In powders, the carrier is a finely divided solid which is in admixture with the finely divided active ingredient. In tablets, the active ingredient is mixed with a carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired.

Various other materials may be present as coatings or to modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain, in addition to the active ingredient, sucrose as a sweetening agent, methyl and propylparabens as preservatives, a dye and a flavoring such as cherry or orange flavor.

Sterile liquid formulations include suspensions, emulsions, syrups, and elixirs. The active ingredient can be dissolved or suspended in a pharmaceutically acceptable carrier, such as sterile water, sterile organic solvent, or a mixture of both sterile water and sterile organic solvent.

The active ingredient can also be dissolved in a suitable organic solvent, for example, aqueous propylene glycol. Other compositions can be made by dispersing the

finely divided active ingredient in aqueous starch or sodium carboxymethyl cellulose solution or in a suitable oil.

Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used, which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active compound doses.

Pharmaceutical preparations which can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the active ingredients in admixture with filler such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds may be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols. In addition, stabilizers may be added.

All formulations for oral administration should be in dosages suitable for such administration. Particularly suitable compositions for oral administration are unit dosage forms such as tablets and capsules.

For parental administration the compounds of the present invention, or salts thereof, can be combined with sterile aqueous or organic media to form injectable solutions or suspensions. Formulations for injection may be presented in unit dosage form, such as in ampoules or in multi-dose containers, with an added preservative. The

compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilizing and/or dispersing agents. The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or
5 dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that each syringability exists. It must be
10 stable under the conditions of manufacture and storage and must be preserved against any contamination. The carrier can be solvent or dispersion medium containing, for example, water, preferably in physiologically compatible buffers such as Hanks's solution, Ringer's solution, or physiological
15 saline buffer, ethanol, polyol (e.g. glycerol, propylene glycol and liquid polyethylene glycol), propylene glycol and liquid polyethylene glycol; suitable mixtures thereof, and vegetable oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent
20 the growth of microorganisms.

The injectable solutions prepared in this manner can then be administered intravenously, intraperitoneally, subcutaneously, or intramuscularly, with intramuscular administration being preferred in humans.

25 For transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art. The active compounds can also be administered intranasally as, for example, liquid drops or spray.

30 For buccal administration, the compositions may take the form of tablets or lozenges formulated in a conventional manner.

For administration by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of a dry powder inhaler, or an aerosol spray presentation from pressurized packs or a nebuliser, with the use of a suitable propellant, e.g., dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of pressurized aerosol the dosage unit may be determined by providing a valve to deliver a metered amount. Capsules and cartridges of gelatin for use in an inhaler or insufflator may be formulated containing a powder mix of the compound and a suitable powder base such as lactose or starch.

Pharmaceutical compositions of the present invention can be manufactured in a manner that is itself known, e.g., by means of conventional mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping or lyophilizing processes.

In making the compositions of the present invention, the active ingredient will usually be admixed with a carrier, or diluted by a carrier, or enclosed within a carrier which may be in the form of a capsule, sachet, paper or other container. When the carrier serves as a diluent, it may be a solid, lyophilized solid or paste, semi-solid, or liquid material which acts as a vehicle, or can be in the form of tablets, pills, powders, lozenges, elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid medium), or ointment, containing, for example, up to 10% by weight of the active compound. The compounds of the present invention are preferably formulated prior to administration.

Example 117

25

Step A:

A methanol solution of methyl 4-methoxyphenylacetate (Aldrich, 10.0 g, 0.056 mol) and hydrazine hydrate (EM
5 Sciences, 27.8 g, 0.556 mol) was stirred at ambient temperature overnight. The resulting solution was concentrated, added to water and extracted with ethyl acetate (2X). The organic layers were combined and washed with aqueous brine then dried over sodium sulfate. Evaporation of the solvent gives a solid
10 product which is washed with hexanes/ether and filtered to give the desired acyl hydrazide as a white solid.

$C_9H_{12}O_2N_2$ (MW = 180.21); mass spectroscopy (MH^+) = 181.0

Step B:

15

A tetrahydrofuran solution (150 mL) of the acyl hydrazide from **Step A** (8.0 g, 0.044 mol) was treated with propyl
20 isocyanate (Aldrich, 1.2 g, 0.014 mol) and stirred at room temperature overnight, during which a precipitate forms. The resulting suspension was treated with methanol (20ml) and stirred for an additional 30 minutes. Hexane was then added and the mixture was filtered to give the desired acyl
25 semicarbazide as a white solid which was used without further purification.

$C_{13}H_{19}N_3O_3$ (MW = 265.31)

Step C:

A methanol solution (150 mL) of the acyl semicarbazide
5 from **Step B** (10.0 g, 0.038 mol) was stirred and treated with
solid potassium hydroxide (21.1 g, 0.377 mol). The mixture was
heated at 60°C for 24 hrs then cooled to ambient temperature
and stirred for 48 hrs. The solvent was reduced to about 75
ml, added to water, acidified to pH 6 with conc. HCl and
10 extracted with ethyl acetate (3X). The organic layers were
combined, washed with aqueous brine and dried over sodium
sulfate. Evaporation of the solvent gives a solid that was
washed with hexane/ether to give the desired N4-propyl
triazolinone as a white solid.
15 $C_{13}H_{17}N_3O_2$ (MW = 247.30); mass spectroscopy (MH⁺) = 248.1

Step D:

The N4-propyl triazolinone from **Step C** (7.0 g, 0.028 mol)
20 is dissolved in DMF (75 mL) and treated with chloro-*p*-xylene
(Aldrich, 6.0 g, 0.043 mol) and powdered potassium carbonate
(Aldrich, 15.6 g, 0.113 mol). The resulting mixture was heated
to 60°C overnight. The cooled reaction mixture was added to
aqueous HCl (1N, 200 mL) and extracted with ethyl acetate (3X).

The combined organic layers were washed with aqueous brine, dried over sodium sulfate and concentrated to give the crude product as an oil. Purification by flash chromatography (gradient: 100% hexanes to 2:1 hexanes:ethyl acetate) gives the
5 desired N2-p-methylbenzyl triazolinone.

$C_{21}H_{25}N_3O_2$ (MW = 351.45); mass spectroscopy (MH⁺) = 352.2

Step E:

10 The N2-p-methylbenzyl triazolinone from **Step D** (1.5 g, 0.004 mol) was dissolved in methylene chloride (25 mL) and cooled under a drying tube. A solution of boron tribromide (3.1 g, 1.2 mL, 0.013 mol) was added dropwise. The reaction
15 mixture was then allowed to warm to ambient temperature and stirred for 2 hrs. The reaction was quenched by the dropwise addition of methanol (5 mL), added to water and extracted with methylene chloride (2X). The organic layers were combined, dried over sodium sulfate and concentrated to give the desired
phenol as an oil which is used without purification.

20 $C_{20}H_{23}N_3O_2$ (MW = 337.4); mass spectroscopy (MH⁺) = 338.3

Step F:

The phenol from **Step E** (1.3 g, 0.004 mol) was dissolved in ethanol (50 mL) and treated with ethyl 2-bromoisobutyrate (Aldrich, 2.3 g, 1.7 mL, 0.012 mol), powdered potassium carbonate (Aldrich, 2.2 g, 0.016 mol) and magnesium sulfate (0.6 g, 0.005 mol). The resulting mixture was stirred and heated to 55°C, under a drying tube, overnight. The cooled reaction mixture was added to HCl (5N, 70ml) and extracted with ethyl acetate (2X). The combined organic layers were dried over sodium sulfate and concentrated to give the crude product. Purification by flash chromatography (gradient: 100% hexanes to 3:2 ethyl acetate:hexanes) gives the desired ethyl ester. $C_{26}H_{33}N_3O_4$ (MW = 451.6); mass spectroscopy (MH^+) = 452.3

Step G:

The ethyl ester from **Step F** (0.8 g, 0.002 mol) was dissolved in methanol (12 mL) and sodium hydroxide (2N, 3.0 mL, 0.006 mol) added. The resulting mixture was stirred at ambient temperature overnight. The reaction mixture was added to HCl (5N, 15ml) and extracted with ethyl acetate (2X). The organic layers were combined, dried over sodium sulfate and concentrated to give the crude product. Purification by flash chromatography (gradient: 100% hexanes to 1:1 ethyl acetate/hexane then 10% methanol in ethylacetate) gives the desired carboxylic acid as a white foam. $C_{24}H_{29}N_3O_4$ (MW = 423.5); mass spectroscopy (MH^+) = 424.3; (MH^-) = 422.1

10 was added in one portion via syringe and the solution was
allowed to stir at ambient temperature for 1 h. The

A 12-L 3-neck round-bottom flask was equipped with an overhead air-driven stirrer apparatus, condenser, nitrogen inlet, thermometer/thermocouple, and heating mantle. The flask was charged with ethyl acetate (450 mL) and 21% (wt.) sodium ethoxide in ethanol solution (3318 mL, 8.87 moles, 2 eq). The resulting mixture was heated to reflux under a nitrogen atmosphere and maintained at reflux for 30 min. The mixture was then allowed to cool slightly below reflux, and 4-(4-hydroxyphenyl)butyric acid (800 g, 4.43 moles) was added. The flask contents were re-heated to reflux for 30 min, at which point ethyl 2-bromoisobutyrate (EBIB, 1954 mL, 13.32 moles, 3.0 eqs.) was added. After 1 h at reflux, the flask was equipped with a 2-L addition funnel, which was charged sodium ethoxide in ethanol solution (1660 mL, 4.43 moles, 1 eq.). The sodium ethoxide solution was added dropwise to the refluxing reaction over 1 h. After an additional 30 min at reflux, HPLC analysis showed the reaction was complete. The heat source was removed and the flask contents were cooled to 5-10 °C and then transferred to a 22-L bottom-outlet flask. While stirring, the mixture was quenched with dilute phosphoric acid (6000 mL), transferred to a 20-L Buchi flask, and concentrated in vacuo to remove ethanol. The resulting aqueous mixture of

crystals and excess EBIB was refrigerated overnight. The crystals were then filtered and washed with water (2000 mL). The solids were removed from the funnel and placed in a 20-L Buchi flask equipped with an overhead stirring apparatus.

5 After the addition of water (2000 mL), the solids were stirred at ambient temperature for 30 min, then filtered and washed with heptane (2 x 2500 mL). The solids were then placed in the vacuum oven and dried at 45 °C to afford the title compound as an off-white solid (1247 g, 95.5%). ¹H NMR

The flask was charged with 2-(4-{3-[1-(4-Methylphenylmethyl)-4-methyl-5-oxo-4,5-dihydro-1H-[1,2,4]triazol-3-yl]-propyl}phenoxy)-2-methyl-propionic acid, ethyl ester (800 g, 1.828 moles), and toluene (4000 mL) followed by 1N NaOH (4023 mL, 2.194 mol, 1.2 eq). The resulting mixture was stirred at ambient temperature for 5 h. The mixture was transferred to a 22-L bottom outlet flask and layers separated. The aqueous layer from the above layer separation was charged to the flask and acidified to pH 2 with concentrated HCl (337 mL). Ethyl acetate was added (8000 mL) and the mixture was transferred to a 22-L bottom-outlet flask. The layers were separated and the organic solution was transferred to a 22-L 3-neck round-bottom flask equipped with a distillation head and overhead stirring apparatus. The mixture was concentrated by distillation of the ethyl acetate to approximately 4000 mL, and fresh ethyl acetate (3600 mL) was added to the reaction vessel. Distillation was continued until 3600 mL of distillate were recovered. Heating was stopped and the mixture was allowed to cool slowly to 60-65 °C, at which point seed crystals (0.8 g) of the desired product were added. The flask contents were allowed to cool slowly until crystallization initiated (55-57 °C), then the mixture was cooled to 0-5 °C and stirred for 1 h. The product was filtered, washed with cold ethyl acetate, and dried in vacuo at 55 °C to afford the title compound as a white solid (713.6 g, 95.3%). ¹H NMR (DMSO-d₆, 500MHz): δ 1.46 (s, 6 H), 1.79 (m, 2 H), 2.25 (s, 3H), 2.35 (t, 2 H), 2.47 (t, 2 H), 4.70 (s, 2 H), 6.71 (d, 2H), 7.03 (d, 2H), 7.10 (m, 4 H). ¹³C NMR (DMSO-d₆), δ 20.6, 25.0, 25.5, 27.7, 47.0, 78.3, 118.6, 127.4, 127.7, 128.9, 128.9, 134.4, 134.5, 136.4, 145.9, 153.4, 154.3, 175.0.

Step A: Preparation of

To a solution of 5-bromo salicylaldehyde (3.15 g, 15.6 mmol) in DMF (10 mL) at room temperature was added K_2CO_3 (5.0 g, 36.2 mmol) and ethyl bromoacetate (2.6 mL, 23.4 mmol). The mixture was stirred at room temperature for one hour. The mixture was diluted with diethyl ether (20 mL) and 1N HCl was added until pH 3-4. The organic layer was separated and washed with water and brine. The organic layer was dried over $MgSO_4$ and the solvent removed under reduced pressure to give the titled compound.

Step B: Preparation of

To a solution of MeONa (prepared from 88 mg of Na (3.8 mmol) in 10 mL of MeOH) was added a solution of the **Step A** product in methanol (1 mL) at room temperature. The mixture was refluxed for 10 minutes in a preheated bath at 80°C. Then, the reaction mixture was allowed to cool to room temperature and the titled compound precipitate from the solution as a white solid. The solid was filtered off and dry under vacuum.

$C_{10}H_7BrO_3$ (MW: 255.07); MS:m/z ($M^+ + 1$) 256.

Step C: Preparation of

15

To a solution of the product prepared as in **Example 38, Step D** (11.3 g, 0.0436 mol) in methyl ethyl ketone (300 mL), was added 3,4-dimethylbenzyl chloride (16.0 mL, 0.1089 mol) followed by potassium carbonate powder (30.1 g, 0.1382 mol). The resulting mixture was stirred at 80-85°C under a drying tube for 48 hours. The reaction mixture was cooled to room temperature and then partitioned between ethyl acetate (300 mL) and NH_4Cl saturated aqueous solution (300 mL). The aqueous layer was extracted with ethyl acetate (200 mL) and the combined organic phase dried over Na_2SO_4 and filtered. Evaporation of solvent gave a crude product, which was purified on a silica gel column eluting with 50% ethyl

Reaction was stirred at 0°C for 15 min and at room temperature for 30 minutes and then poured onto 0.5N HCl (200 mL). The aqueous layer was extracted twice with a 1:1 mixture of Et₂O-hexanes (300 mL) and the combined organic phase dried over Na₂SO₄ and filtered. Evaporation of solvent gave a crude product, which was purified on a silica gel column eluting with 50% ethyl acetate in hexane to give the titled compound as yellow oil.

Biological Assays

Binding and Cotransfection Studies

The in vitro potency of compounds in modulating PPAR α receptors were determined by the procedures detailed below.
25 DNA-dependent binding (ABCD binding) was carried out using SPA technology with PPAR receptors. Tritium-labeled PPAR α agonists were used as radioligands for generating displacement curves and IC_{50} values with compounds of the

invention. Cotransfection assays were carried out in CV-1 cells. The reporter plasmid contained an acylCoA oxidase (AOX) PPRE and TK promoter upstream of the luciferase reporter cDNA. Appropriate PPARs were constitutively
5 expressed using plasmids containing the CMV promoter. For PPAR α , interference by endogenous PPAR γ in CV-1 cells was an issue. In order to eliminate such interference, a GAL4 chimeric system was used in which the DNA binding domain of the transfected PPAR was replaced by that of GAL4, and the
10 GAL4 response element was utilized in place of the AOX PPRE. Cotransfection efficacy was determined relative to PPAR α agonist reference molecules. Efficacies were determined by computer fit to a concentration-response curve, or in some cases at a single high concentration of agonist (10 μ M).

15 These studies were carried out to evaluate the ability of compounds of the invention to bind to and/or activate various nuclear transcription factors, particularly huPPAR α ("hu" indicates "human"). These studies provide in vitro data concerning efficacy and selectivity of compounds of the
20 invention. Furthermore, binding and cotransfection data for compounds of the invention were compared with corresponding data for marketed compounds that act on huPPAR α .

The binding and cotransfection efficacy values found, for compounds of the invention and compounds of this
25 invention which are useful for modulating a PPAR alpha receptor, were \leq 100 nM and \geq 50%, respectively.

Evaluation of Triglyceride Reduction and HDL Cholesterol Elevation in HuapoAI Transgenic Mice

30 Seventeen different series of studies were performed to evaluate the effect of compounds of the present invention upon HDL and triglyceride levels in human apoAI mice. For

each compound tested, seven to eight week old male mice, transgenic for human apoAI (C57BL/6-tgn(apoal)1rub, Jackson Laboratory, Bar Harbor, ME) were acclimated in individual cages for two weeks with standard chow diet (Purina 5001) and water provided ad libitum. After the acclimation, mice and chow were weighed and assigned to test groups (n = 5) with randomization by body weight. Mice were dosed daily by oral gavage for 8 days using a 29 gauge, 1-1/2 inch curved feeding needle (Popper & Sons). The vehicle for the controls, test compounds and the positive control (fenofibrate 100mg/kg) was 1% carboxymethylcellulose (w/v) with 0.25% tween 80 (w/v). All mice were dosed daily between 6 and 8 a.m. with a dosing volume of 0.2ml. Prior to termination, animals and diets were weighed and body weight change and food consumption were calculated. Three hours after last dose, mice were euthanized with CO2 and blood was removed (0.5-1.0 ml) by cardiac puncture. After sacrifice, the liver, heart, and epididymal fat pad were excised and weighed. Blood was permitted to clot and serum was separated from the blood by centrifugation.

Cholesterol and triglycerides were measured colorimetrically using commercially prepared reagents (for example, as available from Sigma #339-1000 and Roche #450061 for triglycerides and cholesterol, respectively). The procedures were modified from published work (McGowan M. W. et al., Clin Chem 29:538-542,1983; Allain C. C. et al., Clin Chem 20:470-475,1974. Commercially available standards for triglycerides and total cholesterol, respectively, commercial quality control plasma, and samples were measured in duplicate using 200 µl of reagent. An additional aliquot of sample, added to a well containing 200 µl water, provided a blank for each specimen. Plates were incubated at room

temperature on a plate shaker and absorbance was read at 500 nm and 540 nm for total cholesterol and triglycerides, respectively. Values for the positive control were always within the expected range and the coefficient of variation for samples was below 10%. All samples from an experiment were assayed at the same time to minimize inter-assay variability.

Serum lipoproteins were separated and cholesterol quantitated by fast protein liquid chromatography (FPLC) coupled to an in line detection system. Samples were applied to a Superose 6 HR size exclusion column (Amersham Pharmacia Biotech) and eluted with phosphate buffered saline-EDTA at 0.5 ml/min. Cholesterol reagent (Roche Diagnostics Chol/HP 704036) at 0.16ml/min mixed with the column effluent through a T-connection and the mixture passed through a 15 m x 0.5 mm id knitted tubing reactor immersed in a 37 C water bath. The colored product produced in the presence of cholesterol was monitored in the flow stream at 505 nm and the analog voltage from the monitor was converted to a digital signal for collection and analysis. The change in voltage corresponding to change in cholesterol concentration was plotted vs time and the area under the curve corresponding to the elution of very low density lipoprotein (VLDL), low density lipoprotein (LDL) and high density lipoprotein (HDL) was calculated using Perkin Elmer Turbochrome software. The results of these studies are provided in the following tables for triglyceride and HDL cholesterol levels. Note that the superscripted numbers in the following tables refer to the study numbers. Further, the values, determined in each study, for triglyceride levels in the control mice and for HDL cholesterol levels in

fenofibrate-treated mice are also provided in the following tables.

Triglyceride Serum Levels in Mice Dosed with a Compound of the Invention was Compared to Mice Receiving the Vehicle to identify compounds which could be particularly useful for lowering triglycerides. Generally, triglyceride decreases of greater than or equal to 30% (thirty percent) compared to control following a 30 mg/kg dose suggests a compound that can be especially useful for lowering triglyceride levels.

The percent increase of HDLc serum levels in mice receiving a compound of the invention was compared to mice receiving vehicle to identify compounds of the invention that could be particularly useful for elevating HDL levels. Generally, an increase of greater than or equal to 25% (twenty five percent) increase in HDLc level following a 30 mg/kg dose suggests a compound that can be especially useful for elevating HDLc levels.

It may be particularly desirable to select compounds of this invention that both lower triglyceride levels and increase HDLc levels. However, compounds that either lower triglyceride levels or increase HDLc levels may be desirable as well.

Evaluation of Glucose Levels in db/db Mice

The effects, upon plasma glucose of administering various dose levels of five different compounds of the present invention and the PPAR gamma agonist rosiglitazone (BRL49653) or the PPAR alpha agonist fenofibrate, and the control, to male db/db mice, were studied.

Five week old male diabetic (db/db) mice [for example, C57BlKs/j-m +/+ Lepr(db), Jackson Laboratory, Bar Harbor,

ME] or lean littermates were housed 6 per cage with food and water available at all times. After an acclimation period of 2 weeks, animals were individually identified by ear notches, weighed, and bled via the tail vein for
5 determination of initial glucose levels. Blood was collected (100 μ l) from unfasted animals by wrapping each mouse in a towel, cutting the tip of the tail with a scalpel, and milking blood from the tail into a heparinized capillary tube. Sample was discharged into a heparinized
10 microtainer with gel separator and retained on ice. Plasma was obtained after centrifugation at 4°C and glucose measured immediately. Remaining plasma was frozen until the completion of the experiment, when glucose and triglycerides were assayed in all samples. Animals were grouped based on
15 initial glucose levels and body weights. Beginning the following morning, mice were dosed daily by oral gavage for 7 days. Treatments were test compounds (30 mg/kg), a positive control agent (30 mg/kg) or vehicle [1% carboxymethylcellulose (w/v)/ 0.25% Tween80 (w/v); 0.3
20 ml/mouse]. On day 7, mice were weighed and bled (tail vein) 3 hours after dosing. Twenty-four hours after the 7th dose (i.e., day 8), animals were bled again (tail vein). Samples obtained from conscious animals on days 0, 7 and 8 were assayed for glucose. After the 24 hour bleed, animals were
25 weighed and dosed for the final time. Three hours after dosing on day 8, animals were anesthetized by inhalation of isoflurane and blood obtained via cardiac puncture (0.5-0.7 ml). Whole blood was transferred to serum separator tubes, chilled on ice and permitted to clot. Serum was obtained
30 after centrifugation at 4°C and frozen until analysis for compound levels. After sacrifice by cervical dislocation,

the liver, heart and epididymal fat pads were excised and weighed.

Glucose was measured colorimetrically using commercially purchased reagents. According to the
5 manufacturers, the procedures were modified from published work (McGowan, M. W., Artiss, J. D., Strandbergh, D. R. & Zak, B. Clin Chem, 20:470-5 (1974) and Keston, A. Specific colorimetric enzymatic analytical reagents for glucose. Abstract of papers 129th Meeting ACS, 31C (1956).); and
10 depend on the release of a mole of hydrogen peroxide for each mole of analyte, coupled with a color reaction first described by Trinder (Trinder, P. Determination of glucose in blood using glucose oxidase with an alternative oxygen acceptor. Ann Clin Biochem, 6:24 (1969)). The absorbance of
15 the dye produced is linearly related to the analyte in the sample. The assays were further modified in our laboratory for use in a 96 well format. The commercially available standard for glucose, commercially available quality control plasma, and samples (2 or 5 μ l/well) were measured in
20 duplicate using 200 μ l of reagent. An additional aliquot of sample, pipetted to a third well and diluted in 200 μ l water, provided a blank for each specimen. Plates were incubated at room temperature for 18 minutes for glucose on a plate shaker (DPC Micormix 5) and absorbance read at 500
25 nm on a plate reader. Sample absorbances were compared to a standard curve (100-800 for glucose). Values for the quality control sample were always within the expected range and the coefficient of variation for samples was below 10%. All samples from an experiment were assayed at the same time
30 to minimize inter-assay variability.

The results of the study, suggest compounds of the present invention that significantly reduced db/db mouse

plasma glucose levels while resulting in body weight gains that were less than those observed for rosiglitazone.

5 Evaluation of the Effects of Compounds of the Present
 Invention upon A^y Mice Body Weight, Fat Mass, Glucose and
 Insulin Levels

Female A^y Mice

 Female A^y mice were singly housed, maintained under
10 standardized conditions (22°C, 12 h light:dark cycle), and
 provided free access to food and water throughout the
 duration of the study. At twenty weeks of age the mice were
 randomly assigned to vehicle control and treated groups
 based on body weight and body fat content as assessed by
15 DEXA scanning (N=6). Mice were then dosed via oral gavage
 with either vehicle or a Compound of this invention (50
 mg/kg) one hour after the initiation of the light cycle (for
 example, about 7 A.M.) for 18 days. Body weights were
 measured daily throughout the study. On day 14 mice were
20 maintained in individual metabolic chambers for indirect
 calorimetry assessment of energy expenditure and fuel
 utilization. On day 18 mice were again subjected to DEXA
 scanning for post treatment measurement of body composition.

 The results of p.o. dosing of compound for 18 days on
25 body weight, fat mass, and lean mass were evaluated and
 suggest which compounds of this invention can be especially
 useful for maintaining desirable weight and/or promoting
 desired lean to fat mass.

 Indirect calorimetry measurements revealed a
30 significant reduction in respiratory quotient (RQ) in
 treated animals during the dark cycle [0.864 ± 0.013
 (Control) vs. 0.803 ± 0.007 (Treated); p < 0.001]. This

reduction in RQ is indicative of an increased utilization of fat during the animals' active (dark) cycle. Additionally, treated animals displayed significantly higher rates of energy expenditure than control animals (17.40 ± 0.49 vs. 13.62 ± 0.26 kcal/kg/hr, respectively).

Male KK/A^y Mice

Male KK/A^y mice were singly housed, maintained under standardized conditions (22°C, 12 h light:dark cycle), and provided free access to food and water throughout the duration of the study. At twenty-two weeks of age the mice were randomly assigned to vehicle control and treated groups based on plasma glucose levels. Mice were then dosed via oral gavage with either vehicle or a Compound of this invention (30 mg/kg) one hour after the initiation of the light cycle (7 A.M.) for 14 days. Plasma glucose, triglyceride, and insulin levels were assessed on day 14.

The results of p.o. dosing of compound for 14 days on plasma glucose, triglycerides, and insulin are evaluated to identify compounds of this invention which may be especially desired.

Method to Elucidate the LDL-cholesterol Total-cholesterol and Triglyceride Lowering Effect of Compound 5(8)

Male Syrian hamsters (Harlan Sprague Dawley) weighing 80-120 g were placed on a high-fat cholesterol-rich diet for two to three weeks prior to use. Feed and water were provided ad libitum throughout the course of the experiment. Under these conditions, hamsters became hypercholesterolemic showing plasma cholesterol levels between 180-280 mg/dl. (Hamsters fed with normal chow had a total plasma cholesterol level between 100-150 mg/dl.) Hamsters with

high plasma cholesterol (180 mg/dl and above) were randomized into treatment groups based on their total cholesterol level using the GroupOptimizeV211.xls program.

A Compound of this invention was dissolved in an aqueous vehicle (containing CMC with Tween 80) such that each hamster received once a day approx. 1 ml of the solution by garvage at doses 3 and 30 mg/kg body weight. Fenofibrate (Sigma Chemical, prepared as a suspension in the same vehicle) was given as a known alpha-agonist control at a dose of 200 mg/kg, and the blank control was vehicle alone. Dosing was performed daily in the early morning for 14 days.

Quantification of Plasma Lipids :

On the last day of the test, hamsters were bled (400 ul) from the suborbital sinus while under isoflurane anesthesia 2 h after dosing. Blood samples were collected into heparinized microfuge tubes chilled in ice bath. Plasma samples were separated from the blood cells by brief centrifugation. Total cholesterol and triglycerides were determined by means of enzymatic assays carried out automatically in the Monarch equipment (Instrumentation Laboratory) following the manufacturer's procedure. Plasma lipoproteins (VLDL, LDL and HDL) were resolved by injecting 25 ul of the pooled plasma samples into an FPLC system eluted with phosphate buffered saline at 0.5 ml/min through a Superose 6 HR 10/30 column (Pharmacia) maintained room temp. Detection and characterization of the isolated plasma lipids were accomplished by postcolumn incubation of the effluent with a Cholesterol/HP reagent (for example, Roche Lab System; infused at 0.12 ml/min) in a knitted reaction coil maintained at 37°C. The intensity of the color formed

was proportional to the cholesterol concentration and was measured photometrically at 505 nm.

The effect of administration of a Compound of this invention for 14 days is studied for the percent reduction in LDL level with reference to the vehicle group. The LDL-lowering efficacy for certain compounds of this invention is markedly more potent than that of fenofibrate. Compounds of this invention that decrease LDL greater than or equal to 30% (thirty percent) compared to vehicle can be especially desired.

The total-cholesterol and triglyceride lowering effects of a Compound of this invention was also studied. The data for reduction in total cholesterol and triglyceride levels after treatment with a compound of this invention for 14 days was compared to the vehicle to suggest compounds that can be particularly desired. The known control fenofibrate did not show significant efficacy under the same experimental conditions.

Method to Elucidate the Fibrinogen-Lowering Effect of PPAR Modulators

Zucker Fatty Rat Model:

The life phase of the study on fibrinogen-lowering effect of compounds of this invention was part of the life phase procedures for the antidiabetic studies of the same compounds. On the last (14th) day of the treatment period, with the animals placed under surgical anesthesia, ~ 3ml of blood is collected, by cardiac puncture, into a syringe containing citrate buffer. The blood sample is chilled and centrifuged at 4°C to isolate the plasma that was stored at -70 °C prior to fibrinogen assay.

Quantification of Rat Plasma Fibrinogen:

Rat plasma fibrinogen levels were quantified by using a commercial assay system consists of a coagulation instrument following the manufacturer's protocol. In essence, 100 ul of plasma was sampled from each specimen and a 1/20 dilution is prepared with buffer. The diluted plasma is incubated at 37°C for 240 seconds. Fifty microliters of clotting reagent thrombin solution (provided by the instrument's manufacturer in a standard concentration) is then added. The instrument monitored the clotting time, a function of fibrinogen concentration quantified with reference to standard samples.

Results :

Compounds of this invention are capable of lowering fibrinogen level in vivo. Compounds that lower fibrinogen level greater than vehicle can be especially desired. Cholesterol and triglyceride lowering effects of compounds of this invention were also produced in Zucker rats.

Method to Elucidate the Anti-body Weight Gain and Anti-appetite Effects of Compounds of this invention**Fourteen-Day Study in Zucker Fatty Rat¹ or ZDF Rat² Models :**

Male Zucker Fatty rats, non-diabetic (Charles River Laboratories, Wilmington, MA) or male ZDF rats (Genetic Models, Inc, Indianapolis, IN) of comparable age and weight were acclimated for 1 week prior to treatment. Rats were on normal chow and water was provided ad libitum throughout the course of the experiment.

α -agonists were dissolved in an aqueous vehicle such that each rat received once a day approximately 1 ml of the solution by garvage at doses 0.1, 0.3, 1 and 3 mg/kg body weight. Fenofibrate (Sigma Chemical, prepared as a suspension in the same vehicle) a known alpha-agonist given at doses of 300 mg/kg, as well as the vehicle were controls. Dosing was performed daily in the early morning for 14 days. Over the course of the experiment, body weight and food consumption were monitored.

Using this assay, compounds of this invention were found to result in significant weight reduction.

EQUIVALENTS:

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 01/42928

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 47-65 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound
2. ☒ Claims Nos.: 1-18, 30, 32-37, 39-68, 73-94 (partly)
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
1-68, 72-94

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

Continuation of Box 1.2

Claims Nos.: 1-18,30,32-37,39-68,73-94 (partly)

Present claims 1-18,30,32-37,39-68,73-94 (all partly) relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds of formula I wherein the group Y-E is in the 4-position and is chosen from CH₂-C-COO or S-C-COO or O-C-COO or O-(CH₂)₁₋₃-COO or O-C-CON or COOH, i.e. those groups under which all of the examples of the application fall and the intermediates of claims 73-92 with the corresponding group Y-E.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. Claims: 1-68,72-94

Compounds of formula I, intermediates for their preparation, processes for their preparation and the use of such compounds and compositions thereof

2. Claims: 69-71

A method of preparation of any triazolone from an acyl semicarbazide.
